
N.G.P. Tobacco ApS

Data platform proposal

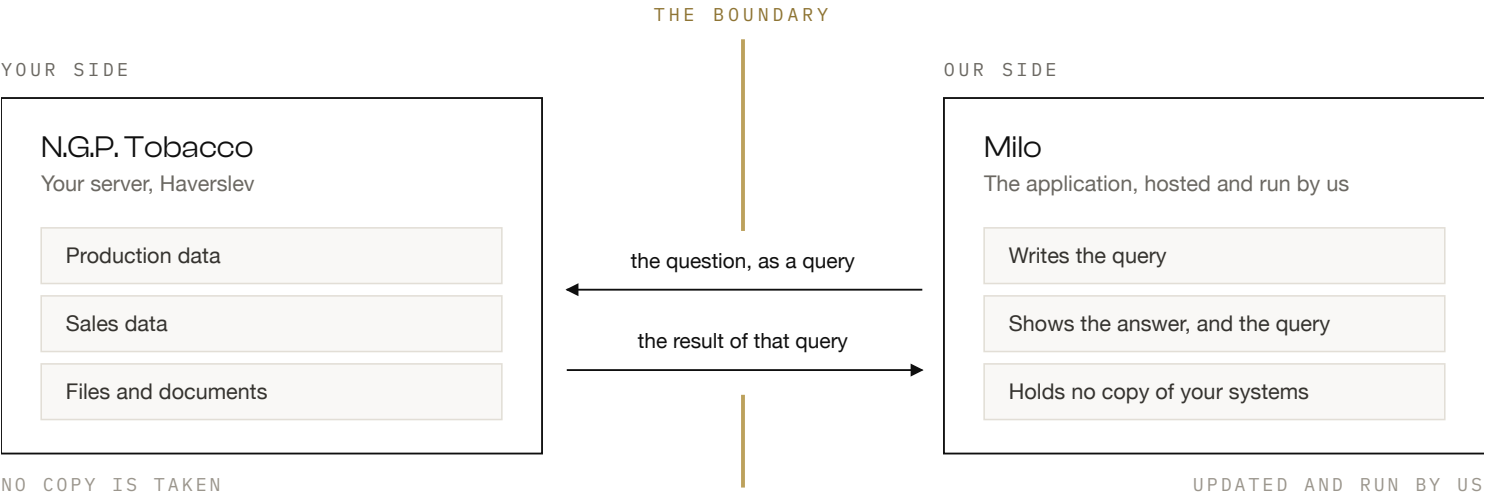

AUGUST 2026

A small group of people, asking questions of confidential data.

- The data N.G.P. holds is confidential and it stays under N.G.P.'s control. That is the condition everything else has to meet.
- Access to it is yours to grant and yours to withdraw, on your terms and without a conversation with us first.
- Three people to begin with: yourself, production management and sales.
- Two jobs to start: production management, and reporting for sales, running in the standard product.

The data stays where it is.

Milo queries your data on your server. What crosses the boundary is a query and the result of that query, not the dataset.

NOTHING ELSE CROSSES THE LINE.

WHAT CROSSES

A query, written from the question somebody asked.

The result of that query, on its way back to the person who asked it.

WHAT DOES NOT

A copy of your dataset. Nothing of yours is replicated into our systems.

Anything used to train a model, by us or by the model providers. That is written into the contract.

Milo reaches your data through an account you create and you control. You set what that account can see. You can narrow it, widen it or switch it off from your side at any point, and you do not need us to do it.

Switch it off and we hold nothing, because there was never a copy to delete.

Milo keeps the conversation: the questions your three people asked, and the answers they were shown, so they can go back to them. It does not build a copy of your systems on our side. When the contract ends, the conversation goes with it.

03 / HOW IT IS MAINTAINED

You maintain nothing.

No Milo software is installed on your server, so there is nothing on your side to patch, restart or keep a version of. No one at N.G.P. picks up a maintenance job because of it.

Updates and fixes happen on our infrastructure. New capability arrives without a release window and without your team scheduling anything around it.

The connection is the only standing thing between us, and it belongs to you. Beyond it we have no access to your environment. If the connection breaks, we tell you and we fix our end of it.

The evidence, and where to check it.

CERTIFICATION

ISO 27001 compliant. SOC 2 Type I compliant, Type II in progress. Independent penetration testing, vulnerability scanning and an internal audit programme run alongside them.

SUB-PROCESSORS

Five, all named publicly: Amazon Web Services for infrastructure, Cloudflare for edge security, ClickHouse for the warehouse, Fivetran for ingestion, Clerk for identity.

ACCESS CONTROL

Roles are set by you and enforced at the data layer, so a person cannot read rows their role does not cover. Every question, and the query it produced, is logged with the user and the timestamp, and your team can export the log.

RETENTION

We hold no copy of your data, so there is no retention period on it to negotiate.

WHERE WE WORK

Regulated gaming operators, and multi-site hospitality and retail businesses, where these questions get asked before anything is connected.

trust.milo.ai

The SOC 2 report, the ISO certificate, the Statement of Applicability and the underlying policies sit behind a request button. Whoever reviews this on your side can request them directly. There is no call with us in between, and we would rather you checked than took our word for it.

[OPEN THE TRUST CENTRE →](#)

05 / WHAT YOU WOULD USE IT FOR

Three people, two jobs, on day one.

This is the shape rather than the detail. We have not been through your systems yet, so treat it as a hypothesis to confirm on the 31st.

PRODUCTION

Ask instead of requesting a report

Questions about output and performance asked in plain language, and answered against live production data rather than a compiled extract of it.

SALES

The reporting, without the compile

The regular sales reporting produced in the same shape each time, so the hours now spent building it go back to the person who builds it.

ALL THREE OF YOU

The working shown

Every answer carries the query that ran and the source it hit, so a number can be checked rather than trusted.

06 / INTEGRATIONS

What we can connect to.

The integrations page on our website lists roughly 700 connectors. It is out of date. The current number is over 1,500, and SharePoint and Microsoft 365 are both supported.

On your ERP: if the system exposes an API, we can generally connect to it. Philip will confirm the specifics once he has the name of the system, and he will say so plainly if there is no clean route in rather than finding out later.

Unlimited users, a first phase, and a price.

The first phase runs to the end of month two. At the end of it we sit down with the three of you, look at what has been used and what has not, and agree what the next phase covers. Users are unlimited from the first day, so bringing in more of the administration team later costs nothing further and needs no new agreement.

Nothing connects to an N.G.P. system until you have signed off how the connection is set up. An NDA is available and we are happy to sign it before the technical conversation rather than after it.

£1,500 one-off

DEPLOYMENT AND DATA CONNECTION

- Connecting Milo to your environment
- Configuring the data boundary
- Access control set up with your team
- Validation against your source systems

£1,250 per month

UNLIMITED USERS AND USAGE

- Every user across the business, not only the three
- Support and updates included

13-MONTH TERM • STANDARD

MONDAY 31 AUGUST

10:30 UK

Philip, our co-founder and CTO, joins the call and takes the technical questions directly.

Two things from your side before then: the name of your ERP system, and confirmation of the three users.
