milo × torbaypharma

What is our real OEE?

A one month proof of concept: Milo reads Sage 200, LabWare, WinMan and your data warehouse, read-only, and gives the team labour utilisation, yield and OEE on your own data. Then you decide.

How much of last week's labour was booked to a manufacturing order?

69%. 780 of 1,124 paid hours were booked to an order. Vial filling has the largest gap, 126 hours, and most of it falls either side of changeovers.

Area	Paid hours	Booked to an order	Utilisation
Vial filling line	412	286	69%
Ampoule line 1	268	171	64%
Ampoule line 2 Backup line	64	22	34%
Inspection and packing	380	301	79%
Total	**1,124**	**780**	**69%**

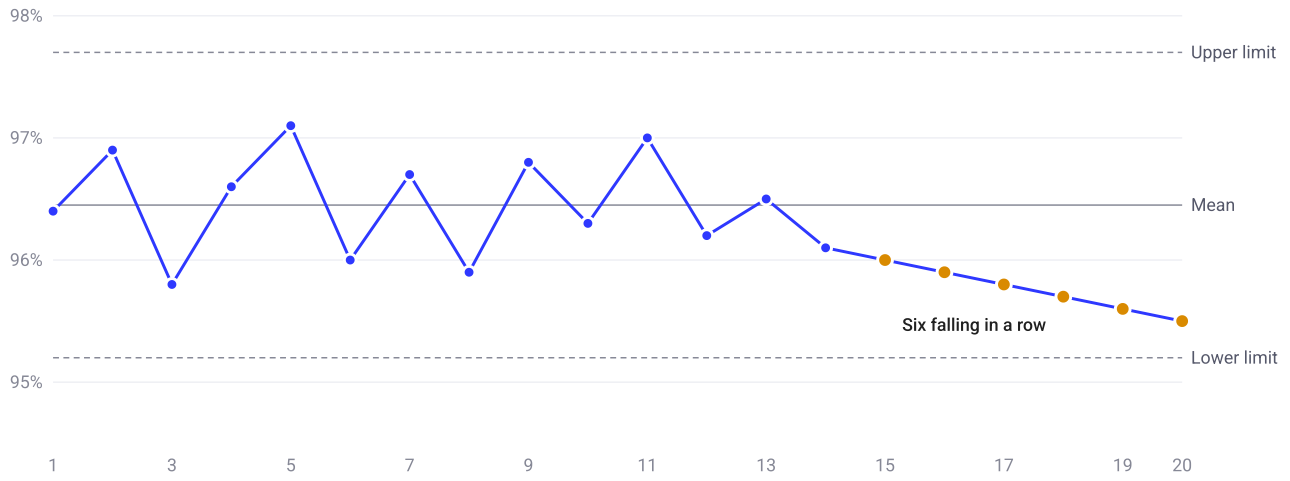

From labour bookings in your data warehouse, and manufacturing orders and routings in WinMan.

Next: Shall I look at next week's schedule, leave and competencies, and flag any shift without the right people on it?

All figures on this page are illustrative sample data. Line names are taken from our calls. In the proof of concept these questions run on your data.

Is yield on Product A drifting? Last 20 batches.

Yes. The last six batches have each come in lower than the one before, from 96.0% down to 95.5%. All are still inside the limits, so this is an early warning. All six used the same excipient lot.

From batch records in WinMan and results in LabWare. Limits are three standard deviations around the mean of the first 14 batches.

Next: Shall I watch every product this way and alert the process team when a trend starts? Any quality decision stays in your QMS.

What is OEE on each line, and what can we trust? Last four weeks.

I can give you **one full OEE today: 46% on vial filling.** The other two lines need more machine data first, so I have only shown what they can support.

Line	Avail.	Perf.	Quality	OEE	Data behind it
Vial filling	61%	78%	97%	**46%**	Edge device, WinMan counts
Ampoule line 1	58%	n/a	96%	Not yet	Partial machine signal, WinMan counts
Ampoule line 2	n/a	n/a	n/a	Not yet	No machine data, sensors to be specified

Next: Shall I list what each line needs for a full OEE, in order of what it would tell you?

The proof of concept

Before it starts

Agree the data

Which equipment and systems can supply data, who will use it, and what a good result looks like.

Week 1

Connect on site

Our integration engineer and head of customer success come to Paignton to connect sources and build with your team.

Weeks 2 to 4

Three working views

Labour utilisation, yield trend, and OEE on one line where machine data exists. Your team asks questions and tries to break them.

End of the month

Decide

Review data coverage, usefulness to the steering group, security and procurement, and the case for carrying on.

Source	How Milo reads it	In the first month
WinMan	Direct read-only SQL. We confirm the route with you in the first step	Orders, routings, batches, material consumed
Data warehouse	Read-only, as the fact and dimension tables develop	Labour bookings
LabWare LIMS	Route agreed in the first step	Results for the yield view
Edge devices	Wherever their data lands. No change to equipment or recipes	One line for OEE
Sage 200, spreadsheets, portals	Connector, or file download where there is no API	Costing checks, if time allows

What Milo does and doesn't do under your QMS

Read-only

Milo reads and reports. It never changes source data, so your systems of record stay as they are.

Not a validated MES

Milo is for analysis and decision support. It doesn't replace a validated pharma MES, and it doesn't make release decisions.

Scheduling is a test

Finite scheduling is possible if the data is connected. In this month we test whether your data can support it. We aren't promising it as a deliverable.

For the steering committee

Security

ISO 27001, SOC 2 Type 2, GDPR. Hosted in Frankfurt. Never used to train AI, never sold or shared. Happy to sign an NDA. Documents at trust.milo.ai.

The business

Milo is built by Autonomous Minds. Manufacturers on it include Kellogg's and Two Tribes, who connected seven systems in two weeks with no data team.

The systems review

Zero capex, and nothing here pre-empts your independent review. Milo gives you the numbers now, and can read whatever systems the review leads to.

Commercials

Proof of concept

£2,000 one-off

- One month's access, about 1,000 interactions
- On-site visit to connect and build with you
- Unlimited users

If you carry on

£2,000 a month, approx.

- Scales with interaction volume
- Viewing dashboards doesn't use interactions
- Unlimited users

What it's for

Senior people stop extracting data by hand, finance stops rebuilding costings in spreadsheets, and you may not need to hire a dedicated data analyst.
