

The Samsung Insights Engine. **Delivered.**

A response to the Insights Engine brief, prepared for Samsung Electronics UK. One page, written to stand alone.

4 weeks

from signature to a working tool
inside Samsung's private cloud

1 quarter

to deliver the brief's 12-month
roadmap, Phases 1 to 3

Zero

data leaving Samsung. No third
parties, no egress, ever

£10–15k

per month. A licence, not a
development project

The opportunity. Samsung's Commercial and Marketing teams hold more data and insight than almost any competitor: a thousand research decks, sell-in and sell-out by retailer, brand trackers, media spend, CRM and device usage data. Very little of it is joined up, so getting an answer out of it takes days of manual work by the Insight team, many requests are repeated, and most marketing briefs go to agencies without insight in them. The Insights Engine brief, written inside Samsung, defines the solution: one trusted, source-grounded tool that any marketer can ask in plain English, with every answer cited back to an approved Samsung source.

The proposal. We deliver that tool. The Samsung Insights Engine runs entirely inside Samsung's private cloud, carries Samsung's name, and is live for users four weeks after signature. It is powered by Milo, a proven insight and analytics engine already deployed in white-label form inside global businesses including Kellanova. There is no development project to fund and no build risk to carry: the brief's 12-month roadmap is delivered in one quarter, and the analytical capability the brief places in Phase 3 is native to the product on day one.

The impact, in three currencies. **Money saved:** fewer repeated research purchases, less agency rework, and no internal build programme to resource. **Time saved:** insight requests answered in seconds rather than days, and the Insight team freed from servicing requests to work on opportunities and threats. **Growth:** joined-up data the business has never been able to analyse together, surfacing patterns across sell-out, brand and media spend that change where the next pound is invested.

The commercial structure. A licence of £10,000 to £15,000 per month depending on tier over a two-year initial term, with a one-off £10,000 deployment fee, hosted by Samsung on Samsung's infrastructure. The first three months operate as the pilot and are judged against the brief's own MVP success criteria. Samsung's data never leaves Samsung, no third-party services are involved, and Samsung retains the deployed application, with software assurance and source-code escrow offered in contract. There is no lower-risk route to this capability, and no faster one.

Proof before signature

Hand us three real decks from the Insights Bank under NDA, including those where charts are flat images, and within a week you will watch your own questions answered on your own content, cited and clicked back to source. It costs Samsung nothing but the NDA.
