

WHAT MILO IS

# Ask the business a question. Get the answer while it still matters.

Milo is an AI data analyst. It connects to the systems Mr.Wheeler already runs and answers questions about trading, stock, customers and margin in plain English, in seconds. There is no dashboard to specify first, no export into a spreadsheet, and no waiting on the one person who knows where the numbers live.

## What it is

An analyst that has already read everything. It holds your orders, stock, customers and spend at the same time, so one question can cross all of them.

## What it replaces

The export and the spreadsheet, and the report that has to be built by somebody before it can tell you anything at all.

## What it takes

Read only access to the systems you have. Live in about a week, nothing to migrate, and nothing new for the team to learn.

HOW IT WORKS

## Connect it once, then just ask.

|                                                                                                                                                                                                              |                                                                                                                                                                                                          |                                                                                                                                                                                                                     |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>01</p> <h3>Connect</h3> <p>Milo reads from what you already run, over 700 integrations plus your own database and the spreadsheets people actually use. Read only. Nothing moves, nothing is rebuilt.</p> | <p>02</p> <h3>Ask</h3> <p>In the browser, in Slack or in Teams, in plain English. Milo works out which data the question needs, runs the numbers across every system at once, and shows its working.</p> | <p>03</p> <h3>Act</h3> <p>Every answer comes with the reason behind it and an offer to do the next thing: pull the list, draft the note, or send the digest at eight in the morning before the trading meeting.</p> |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Milo never asks a language model to do arithmetic. **Calculations run against your data**, so the figures are right every time and each one traces back to the row it came from. The dashboards then build themselves out of whatever the team asks most.

| A QUESTION ON TUESDAY AFTERNOON, TODAY                                                                                                                                                                                                                                                                                                     | THE SAME QUESTION, ON MILO                                                                                                                       |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>15:02            It comes up in the trading meeting.</p> <p>15:40            It goes to the one person who can pull it.</p> <p>Wed am           It joins the queue behind the month end.</p> <p>Thu am           Three exports, joined up in a spreadsheet.</p> <p>Thu 16:45        The answer lands. The call was made on Tuesday.</p> | <p>00:11</p> <p>Answered at 15:02, in the room, on the same data, with nothing built in advance and nobody taken off their week to build it.</p> |

HOW IT WOULD WORK AT MR.WHEELER

## One question, across everything you run.

Your trading picture sits in a platform built for you, and the rest of the story is spread across stock and purchasing, finance, GA4, Meta, email, Trustpilot, the Wine Vault, trade and events, and a good number of spreadsheets. Milo reads all of it, so a question about a mixed case does not stop at the website.

Ecommerce platform

Stock & purchasing

Finance

GA4 & GTM

Meta

Email & CRM

Trustpilot

Wine Vault

Trade & events

Spreadsheets

### TRADING

“Which mixed cases still make money once carriage, breakage and the discount are counted?”

“If the last three weeks carry on, where does the month land against last year?”

### BUYING

“What have we over-bought against the last twelve weeks of sales, by producer?”

“What is still sitting in the Wine Vault from 2019, and what has it done since?”

### CUSTOMERS

“How many people who bought a case before Christmas came back before the summer?”

“What does a Rewards member spend in a year against everybody else?”

### MARKETING

“Which Journal pieces sell wine rather than just bring traffic?”

“What is Meta returning once the second order is counted, not just the first?”

ASK MILO Which mixed cases actually made money last quarter?

Milo just now

Nine of your twelve bottle mixed cases hold margin. **Three lose it at the door**, once carriage and breakage are in.

#### WHY

The three all sit under £95 and ship as twelve bottles, so carriage and packing take 14% of the order before the case discount is applied. The same wines sold as a six make 21%.

Figures here are illustrative. The behaviour is not: on your own data every answer shows its working and traces back to source.

### Where the data sits

Nothing is pasted into a public chatbot. Milo runs in your own environment, your data is never used to train a model, and access follows the permissions your team already has. Every answer is auditable back to the source row.
