YOU

Which corporate clients have gone quiet on us, and is anyone already looking at competitors?

84 accounts, £6.2m of annualised volume, no settled trade in 60 days. Four of them have been searching competitor terms this month.

HIGHEST VALUE DORMANT ACCOUNTS

ACCOUNT	OWNER	LAST TRADE	ANNUALISED	SIGNAL
Corporate account #4471	R. Okafor	78 days	£840k	Browsing, no contact
Corporate account #2019	S. Whitfield	71 days	£615k	Rate query, no reply
Corporate account #8802	R. Okafor	66 days	£520k	Competitor searches
Corporate account #1174	M. Delacroix	92 days	£487k	Competitor searches
Corporate account #6630	S. Whitfield	63 days	£410k	Seasonal, fine

WHY, AND HOW I GOT THERE

- Dormancy is measured against **each account's own trading rhythm**, not a flat 60 days. A weekly trader gone three weeks quiet matters more than a quarterly trader at day 60.
- The signal column comes from Google Ads brand and competitor terms, website sessions and D365 activity. **Four accounts have been searching competitor terms this month**, #1174 for three weeks.
- Twenty-two of the 84 have **no logged contact attempt at all** since going quiet.

Dynamics 365 · Activities

Google Ads

Website sessions

I can push those 22 to their owners in D365 as tasks this afternoon, with the reason and the last trade attached. **Nothing sends without a human approving it.**

YOU

Which Google Ads campaigns produced funded corporate accounts last quarter? Not leads. Funded, trading accounts.

Six campaigns produced funded accounts. Two of them took 71% of the spend and produced 9% of the volume.

Q2 SPEND AGAINST TRADED VOLUME FROM FUNDED ACCOUNTS

Brand · exact		£4.1m
FX risk mgmt · corp		£2.9m
Intl payments · generic		£0.6m
Currency transfer · broad		£0.3m
Competitor conquest		£0.1m

WHY, AND HOW I GOT THERE

- I joined **Google Ads GCLID** to the D365 lead record, followed it through to account creation, then out to the **first settled trade** on the trading platform. That join has never existed for you.
- The two broad-match campaigns produce the most leads by a distance. They also take the longest to fund, at **94 days median** against 31 for brand exact.
- Attribution here is first non-brand touch. Say the word and I will rerun it on last touch so you can see how far the answer moves.

Trading platform · Deals

Move the broad-match budget into the two campaigns that fund and, on last quarter's rates, that is **roughly £1.9m more traded volume for the same spend**. Want me to draft the Q3 reallocation as a one-pager for your CCO?

ILLUSTRATIVE FIGURES

Every number on this screen is sample data shaped like yours, not moneycorp's. Please don't quote them internally. During the two months we run these same questions against your own D365, trading platform, HubSpot and Google accounts.

You don't have to wait for Fabric.

Fabric is a data platform, and Copilot on top of it answers questions about what Microsoft can see. The timelines we hear for a Fabric build at your size run to twelve to eighteen months before the first question gets asked. Milo is live in weeks, across everything you run, and if Fabric arrives later it becomes one more source.

	MILO	FABRIC WITH COPILOT
Time to the first answer	✔ Live inside a week on our cloud. Two to three weeks inside your own tenant.	✗ A platform build first. Twelve to eighteen months is the number we keep hearing.
Sources outside Microsoft	✔ Dynamics 365, SQL Server, Tableau, HubSpot, Google Ads, Apollo and the trading platform, connected natively.	✗ Microsoft sources natively. Everything else is a pipeline your team builds, owns and patches.
When a connection breaks	✔ Our engineers get the alert and fix it, usually before anyone at moneycorp has noticed.	✗ You find out when the numbers look wrong, days or weeks later.
Permissions	✔ Row and column level per person, enforced at the data layer, set up with you in clicks.	✗ Inherits Microsoft 365 permissions where they are configured. Row-level security is a semantic model project.
How the answer is produced	✔ Milo writes the query, runs it on your data and shows the SQL. The model never does the maths. Each task goes to the best current model, Claude and Gemini among them, and you can pin one if policy requires.	✗ A language model summarising the documents and spreadsheets in front of it, on whichever model Microsoft ships.
Alerts and delivery	✔ Scheduled reports and alerts into Teams, email and WhatsApp. Tasks straight into Dynamics 365.	✗ You go and ask it.

Fabric, when it lands

Syns every hour by default, every five minutes where it matters. Anything missing gets built by us rather than added to a roadmap.

WHERE ANSWERS LAND

Teams

Email

WhatsApp

Dynamics 365 tasks

Milo dashboards and apps

Nobody has to live in another tool. Ask in Teams, get the answer in Teams. Follow-ups land in Dynamics 365 as tasks against the account owner.

Trust is our true currency.

The four questions that come up every time we work with a regulated business. Everything below is checkable at **trust.milo.ai**, and our CTO will walk your IT team through it, at your offices if that is easier.

Q1 Does it train on our data?

No. Not by us, and not by the model providers. It is written into the contract rather than sitting on a policy page we can revise later. Your data answers the question in front of it and does nothing else.

Data Handling Policy · Data Retention and Disposal Policy

Q2 Can you ring fence it?

Permissions sit under every question and are enforced at the data layer, so Milo cannot read rows the person is not entitled to. A private client analyst asking about corporate margin gets nothing back. Every question, answer and dashboard opened is logged with the user, the timestamp and the query that ran, and your team can export it.

Data classification and access control · Least-privilege access · Centralized log collection

Q3 What certifications do you hold?

ISO 27001 compliant. SOC 2 Type I compliant, Type II in progress. Independent penetration testing, static application security testing, vulnerability scanning and an internal audit programme. The SOC 2 report, the ISO certificate and the Statement of Applicability sit behind a request button at trust.milo.ai. Your team requests, we release, no sales call in between.

Send them to **trust.milo.ai**

Q4 Do you have financial services clients?

STRAIGHT ANSWER

Not in FX. You would be our first, and your team would find that out in ten minutes anyway.

What we do have is a client base that gets audited hard. **loto.lt**, the Lithuanian national lottery, where the regulator sets the data handling bar. **Betgames** and **Octoplay**, licensed gaming suppliers operating across multiple jurisdictions, each with its own auditor. An insurance client. And **Kellogg's**, where operations and commercial finance teams ask Milo across dozens of markets, which settles the question of scale. Gaming is where Milo was built, and where the security work came from.

Betgames and loto.lt listed at trust.milo.ai

WHERE IT RUNS · YOUR IT TEAM PICKS, AND NOTHING CONNECTS UNTIL THEY HAVE

A

Milo cloud. Our AWS, EU or UK region. Read-only connections, live inside a week. Five named subprocessors, all public.

B

Your own tenant. Milo inside moneycorp's AWS account and VPC. Your keys, your network rules, your CloudTrail. Two to three weeks.

C

On-premise, air-gapped. Everything on your servers, model included, no provider in the chain. Scoped with our CTO first.

Two months. £3,000 a month. Then you decide.

We connect Dynamics 365, SQL Server, the trading platform, HubSpot, Google Ads, Tableau and whatever else matters. We build the dashboards and apps with you rather than handing over an empty product. We train the team, or you just ask Milo. **If it has not earned its place after two months, you stop and we refund £3,000.**

Rollout starts the day the contract is signed. Nothing connects to a moneycorp system until your IT team has signed off how it is deployed. If they say no, this stops here and we part on good terms.

£6,000

Two-month proof of concept, £3,000 a month, everything included

- ✓ All connections built and tested
- ✓ Dashboards and apps built with your team
- ✓ Roles and permissions configured to your model
- ✓ A lunchtime session at your office, or don't bother and just ask it
- ✓ Unlimited users across the business

Stop at the end of month two and £3,000 comes back. Carry on and it is around £3,000 a month, depending on usage. No licence to sign and no notice period.

FROM SIGNATURE

What the two months look like. Two people from your side lead it, and the rest of the team joins as it proves useful.

DAY 1

Contract signed. Kick-off with your account manager and an engineer. The Microsoft connections are live the same day.

DAYS 2 TO 3

The remaining systems connected and tested. The ones that need credentials from your side take a day or two.

WEEK 1

You bring the first three things you want to see. We build them with you as dashboards and apps.

WEEKS 2 TO 4

Colleagues invited in one at a time, permissions set per role as each person joins.

MONTH 2

Once five or so people are on, we come to your office for an hour at lunchtime, laptops open, and the team asks it questions with us in the room.

END OF MONTH 2

Keep going at around £3,000 a month, depending on usage. Or stop, and £3,000 comes back.
